April 26, 2016

Abstract

The `structview` package is part of the sTeX collection, a version of TeX/LaTeX that allows to markup TeX/LaTeX documents semantically without leaving the document format, essentially turning TeX/LaTeX into a document format for mathematical knowledge management (MKM).

This package supplies infrastructure for OMDoc structures and views: complex semantic relations between modules/theories.

1 Introduction

Structures and views constitute ways of defining and relating theories in a theory graph that considerably extend the "object-oriented inheritance" constituted by the imports relation given by the STEX `module` package.

Structures are like imports, only that they allow to define new theories via inheritance with renaming. Views relate pre-existing theories and model conceptual refinements, framing, and implementation relations, again via a mapping between the languages defined by the source and target theories; we call these mappings **theory morphisms**.

For details about theory morphisms we refer to [RK13], but hope to make the underlying concepts clear with examples.

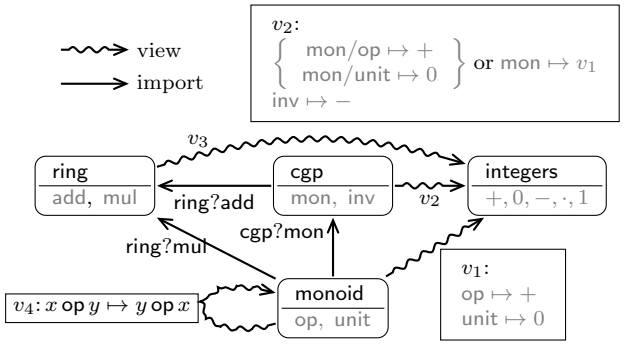

Figure 1: A Theory Graph with Structures and Views

EdN:1 [1]

2 The User Interface

The main contributions of the `modules` package are the `module` environment, which allows for lexical scoping of semantic macros with inheritance and the `\symdef` macro for declaration of semantic macros that underly the `module` scoping.

2.1 Package Options

`mh` The `mh` option turns on MathHub support.

2.2 Theory Morphisms

A theory moprhism is a mapping between the languages of its source and target theory. This can be described mathematically using all the structures in the

[1] EdNote: explain the contribution of structures and views to theory graphs and synchronize with Figure 1.

sTeX distribution. However, in many situations, the language transformation of a morphism can be given in form of **assignments** that map symbols of the source theory to expressions of the target theory.

EdN:2 There are three kinds assignments:[2]

`\vassign` **symbol assignments** via `\vassign{`⟨*sym*⟩`}{`⟨*exp*⟩`}`, which maps a symbol ⟨*sym*⟩ from source theory an expression ⟨*exp*⟩ in the target theory.

`\fassign` **function assignments** via `\fassign{`⟨*bvars*⟩`}{`⟨*pat*⟩`}{`⟨*exp*⟩`}`, is a variant which maps a function symbol ⟨*sym*⟩ by mapping a pattern expression ⟨*pat*⟩ (⟨*sym*⟩ applied to ⟨*bvars*⟩) to an expression ⟨*exp*⟩ in the target theory on bound variables ⟨*bvars*⟩.

`\tassign` **term assignments** via `\tassign{`⟨*sym*⟩`}{`⟨*tname*⟩`}`, another special case, where the value is the symbol with name ⟨*tname*⟩ in the target theory.

EdN:3 Figure 1 shows a concrete example[3]

The assignments above can be seen as abbreviations for a simple, formal definitions, which define a symbol of the source theory by an expression in the target theory.

2.3 Structures

`structure` Structures are specified by the `sstructure`[1] environment:

`\begin{sstructure}[`⟨*keys*⟩`]{`⟨*name*⟩`}{`⟨*sthy*⟩`}`⟨*morph*⟩`\end{sstructure}`

gives the structure the name ⟨*name*⟩, specifies the "source theory" via its identifier ⟨*sthy*⟩, and the morphism ⟨*morph*⟩. The `structure` environment takes the same keys as the `\importmodule` macro, which it generalizes. The morphism ⟨*morph*⟩ in the body of the `structure` environment specifies the morphism (see 2.2 above). In a structure, we take the target theory to be the current theory.

2.4 Views

A view is a mapping between modules, such that all model assumptions (axioms)
EdN:4 of the source module are satisfied in the target module. [4]

3 Limitations & Extensions

In this section we will discuss limitations and possible extensions of the `modules` package. Any contributions and extension ideas are welcome; please discuss ideas, requests, fixes, etc on the sTeX TRAC [**sTeX:online**].

[2] EdNote: MK: we need better macros here.
[3] EdNote: adapt when we fully understand this, and the implementation works.
[1] The old `importmodulevia` environment is now deprecated.
[4] EdNote: Document and make Examples

```
\begin{module}[id=ring]
\symdef{rbase}{R}
\symdef{rtimes}[2]{\infix\cdot{#1}{#2}}
\symdef{rone}{1}
\begin{sstructure}{mul}{monoid}
  \tassign{magbase}{rbase}
  \fassign{a,b}{\magmaop{a}b}{\rtimes{a}b}
  \tassign{monunit}{rone}
\end{sstructure}
\symdef{rplus}[2]{\infix+{#1}{#2}}
\symdef{rminus}[1]{\infix-{#1}{#2}}
\begin{sstructure}{add}{cgroup}
  \fassign{a,b}{\magmaop{a}b}{\rplus{a}b}
  \tassign{monunit}{rzero}
  \tassign{cginvOp}{\rminus}
\end{sstructure}
...
\end{module}
```

Example 1: A Module for Rings with inheritance from monoids and commutative groups

4 The Implementation

4.1 Package Options

We declare some switches which will modify the behavior according to the package options. Generally, an option `xxx` will just set the appropriate switches to true (otherwise they stay false). The options we are not using, we pass on to the `sref` package we require next.

```
⟨*package⟩
\newif\if@structview@mh@\@structview@mh@false
\DeclareOption{mh}{\@structview@mh@true
\PassOptionsToPackage{\CurrentOption}{modules}}
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{modules}}
\ProcessOptions
```

The next measure is to ensure that the `sref` and `xcomment` packages are loaded (in the right version). For LaTeXML, we also initialize the package inclusions.

```
\if@structview@mh@\RequirePackage{structview-mh}\fi
\RequirePackage{modules}
```

4.2 Theory Morphisms by Assignments

EdN:5 `\*assign` [5]

[5] EdNote: probably get rid of the optional argument

```
\newrobustcmd\vassign[3][]{\ifmod@show\ensuremath{#2\mapsto #3}, \fi}%
\newrobustcmd\fassign[4][]{\ifmod@show \ensuremath{#3(#2)\mapsto #4}, \fi}%
\newrobustcmd\tassign[3][]{\ifmod@show \ensuremath{#2\mapsto} #3, \fi}%
```

4.3 Structures

sstructure

The `structure` environment just calls `\importmodule`, but to get around the group, we first define a local macro `\@@doit`, which does that and can be called with an `\aftergroup` to escape the environment grouping introduced by `structure`.

```
\newenvironment{sstructure}[3][]{%
  \gdef\@@doit{\importmodule[#1]{#3}}%
  \ifmod@show\par\noindent importing module #3 via \@@doit\fi%
}{%
  \aftergroup\@@doit\ifmod@show end import\fi%
}%
```

importmodulevia

This is now deprecated, we give an error, but punt to `structure`.

```
\newenvironment{importmodulevia}[2][]%
{\PackageError{structview}%
  {The {importmodulevia} environment is deprecated}{use the {sstructure} instead!}%
  \begin{sstructure}[#1]{missing}{#2}}
{\end{sstructure}}
```

4.4 Views

We first prepare the ground by defining the keys for the `view` environment.

```
\srefaddidkey{view}
\addmetakey*{view}{title}
\addmetakey{view}{display}
\addmetakey{view}{from}
\addmetakey{view}{to}
\addmetakey{view}{creators}
\addmetakey{view}{contributors}
\addmetakey{view}{srccite}
\addmetakey{view}{type}
\addmetakey[sms]{view}{ext}
```

\view@heading

Then we make a convenience macro for the view heading. This can be customized.

```
\newcounter{view}[section]
\newrobustcmd\view@heading[4]{%
  \if@importing%
  \else%
    \stepcounter{view}%
    \edef\@display{#3}\edef\@title{#4}%
    \noindent%
      \ifx\@display\st@flow%
      \else%
```

```
        {\textbf{View} {\thesection.\theview} from \textsf{#1} to \textsf{#2}}%
        \sref@label@id{View \thesection.\theview}%
        \ifx\@title\@empty%
          \quad%
        \else%
          \quad(\@title)%
        \fi%
        \par\noindent%
      \fi%
      \ignorespaces%
  \fi%
}%ifmod@show
```

`view` The `view` environment relies on the `@view` environment (used also in the SᴛEX module signatures) for module bookkeeping and adds presentation (a heading and a box) if the `showmods` option is set.

```
\newenvironment{view}[3][]{%
  \metasetkeys{view}{#1}%
  \sref@target%
  \begin{@view}{#2}{#3}%
  \view@heading{#2}{#3}{\view@display}{\view@title}%
}{%
  \end{@view}%
  \ignorespaces%
}%
\ifmod@show\surroundwithmdframed{view}\fi%
```

`@view` The `@view` does the actual bookkeeping at the module level.

```
\newenvironment{@view}[2]{%from, to
  \@importmodule[\view@from]{#1}{\view@ext}%
  \@importmodule[\view@to]{#2}{\view@ext}%
}{}%
```

`viewsketch` The `viewsketch` environment behaves like `view`, but only has text contents.

```
\newenvironment{viewsketch}[3][]{%
  \metasetkeys{view}{#1}%
  \sref@target%
  \begin{@view}{#2}{#3}%
  \view@heading{#2}{#3}{\view@display}{\view@title}%
}{%
  \end{@view}%
}%
\ifmod@show\surroundwithmdframed{viewsketch}\fi%
```

EdN:6 `\obligation` The `\obligation` element does not do anything yet on the latexml side.[6]

```
\newrobustcmd\obligation[3][]{%
  \if@importing%
```

[6] EdNote: document above

```
  \else Axiom #2 is proven by \sref{#3}%
  \fi%
}%
⟨/package⟩
```
