Abstract

The `smglom` package is part of the sTeX collection, a version of TeX/LaTeX that allows to markup TeX/LaTeX documents semantically without leaving the document format, essentially turning TeX/LaTeX into a document format for mathematical knowledge management (MKM).

This package supplies an infrastructure for writing OMDoc glossary entries.

Contents

1 Introduction

2 The User Interface

2.1 Package and Class Options

`smglom.cls` accepts all options of the `omdoc.cls` and `article.cls` and just passes them on to these.

3 Implementation: The SMGloM Class

3.1 Class Options

To initialize the `smglom` class, we pass on all options to `omdoc.cls` as well as the `stex` and `smglom` packages.

```
⟨*cls⟩
\DeclareOption*{\PassOptionsToClass{\CurrentOption}{omdoc}
                             \PassOptionsToPackage{\CurrentOption}{stex}
                             \PassOptionsToPackage{\CurrentOption}{smglom}}
\ProcessOptions
⟨/cls⟩
```

EdN:1 We load `omdoc.cls`, the `smglom` package that provides the SMGloM-specific functionality[1], and the `stex` package to allow OMDoc compatibility.

```
⟨*cls⟩
\LoadClass{omdoc}
\RequirePackage{smglom}
\RequirePackage{stex}
\RequirePackage{amstext}
\RequirePackage{amsfonts}
⟨/cls⟩
```

Now we do the same thing for the package; first the options, which we just pass on to the `stex` package.

```
⟨*sty⟩
\DeclareOption*{\PassOptionsToPackage{\CurrentOption}{statements}
                             \PassOptionsToPackage{\CurrentOption}{structview}
                             \PassOptionsToPackage{\CurrentOption}{smultiling}}
\ProcessOptions
⟨/sty⟩
```

We load `omdoc.cls`, and the desired packages. For the LaTeXML bindings, we make sure the right packages are loaded.

```
⟨*sty⟩
\RequirePackage{statements}
\RequirePackage[langfiles]{smultiling}
\RequirePackage{structview}
⟨/sty⟩
```

3.2 For Module Definitions

`\gimport` Just a shortcut, we have a starred and unstarred version, the first one is conservative. For example, if we execute:

```
\gimport[smglom/numberfields]{naturalnumbers}
```

[1] EdNote: MK:describe that above

First we are redirected to `\@gimport@nostar`, we store the `smglom/numberfields`⟨*the repo's path*⟩ in `\@test`, then store `\mh@currentrepos`⟨*current directory*⟩ in `\mh@repos`. If no repo's path is offered, that means the module to import is under the same directory, so we let `repos=\mh@repos` and pass bunch of parameters to `\importmhmodule`, which is defined in `module.sty`. If there's a repo's path, then we let repos=⟨*the repo's path*⟩. Finally we use `\mhcurrentrepos`(defined in `module.sty`) to change the `\mh@currentrepos`.

```
⟨*sty⟩
\def\gimport{\@ifstar\@gimport@star\@gimport@nostar}%
\newrobustcmd\@gimport@star[2][]{%
  \def\@test{#1}%
  \edef\mh@@repos{\mh@currentrepos}%
  \ifx\@test\@empty%
    \importmhmodule[conservative,repos=\mh@@repos,ext=tex,path=#2]{#2}%
  \else%
    \importmhmodule[conservative,repos=#1,ext=tex,path=#2]{#2}%
  \fi%
  \mhcurrentrepos{\mh@@repos}%
  \ignorespaces%
}%
\newrobustcmd\@gimport@nostar[2][]{%
  \def\@test{#1}%
  \edef\mh@@repos{\mh@currentrepos}%
  \ifx\@test\@empty%
    \importmhmodule[repos=\mh@@repos,ext=tex,path=#2]{#2}%
  \else%
    \importmhmodule[repos=#1,ext=tex,path=#2]{#2}%
  \fi%
  \mhcurrentrepos{\mh@@repos}%
  \ignorespaces%
}%
⟨/sty⟩
```

`guse` just a shortcut

```
⟨*sty⟩
\newrobustcmd\guse[2][]{%
  \def\@test{#1}%
  \edef\mh@@repos{\mh@currentrepos}%
  \ifx\@test\@empty%
    \usemhmodule[repos=\mh@@repos,ext=tex,path=#2]{#2}%
  \else%
    \usemhmodule[repos=#1,ext=tex,path=#2]{#2}%
  \fi%
  \mhcurrentrepos{\mh@@repos}%
  \ignorespaces%
}%
⟨/sty⟩
```

`*nym`

```
⟨*sty⟩
\newrobustcmd\hypernym[3][]{\if@importing\else\par\noindent #2 is a hypernym of #3\fi}%
\newrobustcmd\hyponym[3][]{\if@importing\else\par\noindent #2 is a hyponym of  #3\fi}%
\newrobustcmd\meronym[3][]{\if@importing\else\par\noindent #2 is a meronym of #3\fi}%
⟨/sty⟩
```

EdN:2 `\MSC` to define the Math Subject Classification, [2]

```
⟨*sty⟩
\newrobustcmd\MSC[1]{\if@importing\else MSC: #1\fi}%
⟨/sty⟩
```

3.3 For Language Bindings

Here we adapt the `smultiling` functionality to the special situation, where the module and file names are identical by design.

`gviewsig` The `gviewsig` environment is just a layer over the `mhviewsig` environment with the keys suitably adapted.

```
⟨*sty⟩
\newenvironment{gviewsig}[4][]{%
  \def\test{#1}%
  \ifx\@test\@empty%
    \begin{mhviewsig}[frompath=#3,topath=#4]{#2}{#3}{#4}%
  \else%
    \begin{mhviewsig}[frompath=#3,topath=#4,#1]{#2}{#3}{#4}%
  \fi%
}{%
  \end{mhviewsig}%
}%
```

`gviewnl` The `gviewnl` environment is just a layer over the `mhviewnl` environment with the keys suitably adapted.

```
\newenvironment{gviewnl}[5][]{%
  \def\@test{#1}\ifx\@test\@empty%
    \begin{mhviewnl}[frompath=#4,topath=#5]{#2}{#3}{#4}{#5}%
  \else%
    \begin{mhviewnl}[frompath=#4,topath=#5,#1]{#2}{#3}{#4}{#5}%
  \fi%
}{%
  \end{mhviewnl}%
}%
⟨/sty⟩
```

EdN:3 `\gincludeview` [3]

```
⟨*sty⟩
\newcommand\gincludeview[2][]{}%
⟨/sty⟩
```

[2]EdNote: MK: what to do for the LaTeXML side?

[3]EdNote: This is fake for now, needs to be implemented and documented

3.4 Authoring States

We add a key to the module environment.

```
⟨*sty⟩
\addmetakey{module}{state}%
⟨/sty⟩
```

3.5 Shadowing of repositories

`\repos@macro`

`\repos@macro` parses a GitLab repository name ⟨*group*⟩`/`⟨*name*⟩ and creates an internal macro name from that, which will be used

```
⟨*sty⟩
\def\repos@macro#1/#2;{#1@shadows@#2}%
```

`\shadow`

`\shadow{`⟨*orig*⟩`}{`⟨*fork*⟩`}` declares a that the private repository ⟨*fork*⟩ shadows the MathHub repository ⟨*orig*⟩. Internally, it simply defines an internal macro with the shadowing information.

```
\def\shadow#1#2{\@namedef{\repos@macro#1;}{#2}}%
⟨/sty⟩
```

`\MathHubPath`

`\MathHubPath{`⟨*repos*⟩`}` computes the path of the fork that shadows the MathHub repository ⟨*repos*⟩ according to the current `\shadow` specification. The computed path can be used for loading modules from the private version of ⟨*repos*⟩.

```
⟨*sty⟩
\def\MathHubPath#1{\@ifundefined{\repos@macro#1;}{#1}{\@nameuse{\repos@macro#1;}}}%
⟨/sty⟩
```
