owl2onto.cls: Marking up OWL2 Ontologies in $\underline{STEX.}^*$

Michael Kohlhase Jacobs University, Bremen http://kwarc.info/kohlhase

April 5, 2016

Abstract

The owl2onto class allows mark up OWL2 Ontologies in STeX and generate OWL2-XML from them via the LaTeXML system.

^{*}Version ? (last revised ?)

Experimental! do not use!

1 The User Interface

The owl2onto package allows mark up ontology-based Metadata in LATeX documents that can be harvested by automated tools or exported to PDF.¹

The main idea behind the owl2onto class and package is to think of (documented) ontologies as documents, which present the knowledge behind ontology informally to the (human) reader and at the same time contain enough (hidden) information so that a formal ontology can be generated from them.

1.1 Package Options

showmeta

EdN:1

EdN:2

The owl2onto package takes a single option: showmeta. If this is set, then the metadata keys are shown (see [Koh15] for details and customization options).

1.2 Ontologies

ontology

The owl2onto class provides the ontology environment environment to declare OWL classes; it takes the place of the usual document environment¹, but its optional argument provides KeyVal attributes that allow to mark up the semantic aspects of the class, see Figure 3. In this example, we only have a single class declaration.

```
\documentclass{owl2onto}
\begin{ontology}[id=foaf,baseURI=http://xmlns.com/foaf/0.1/]
\declaration[type=Class,name=Agent,cseq=agent]
{An agent (eg. person, group, software or physical artifact).}
\end{ontology}
```

Class: Agent

An agent (eg. person, group, software or physical artifact).

Example 1: A simple Ontology in LATEX and its presentation

1.3 Declarations

\declaration type

In general the \declaration macro can be used to declare the objects of various types in an ontology. The type key is used to specify this, its values range over the set². The name attribute specifies the name of the declared object. This

name

¹EdNote: continue

¹Admittedly, it is somewhat unconventional to use the document environment for this, but this is the best way to ensure that we an OWL/XML document with a single document root.

 $^{^2{}m EDNOTE}$: give a list of all of them.

information is used in the XML generation; see Figure 2 for the result of generating XML from Figure 3. Finally, the cseq key allows to specify a command sequence cseq for the object, which an be used in properties.

```
<?xml version="1.0"?>
<!--This OWL2 ontology is generated from an sTeX-encoded one via LaTeXML, you may want to reconsider editing it.-->
<Ontology xmlns="http://www.w3.org/2002/07/owl#"</pre>
         xmlns:stex="http://kwarc.info/ns/sTeX"
         xmlns:omdoc="http://omdoc.org/ns"
         ontologyIRI="http://xmlns.com/foaf/0.1/"
         xml:base="http://xmlns.com/foaf/0.1//"
         xml:id="foaf"
  <Import>ow12.omdoc#OWL2</Import>
  <Declaration stex:srcref="test.tex#textrange(from=5;0,to=5;64)">
   <Class IRI="Agent"/>
  </Declaration>
  <AnnotationAssertion>
   <AnnotationProperty IRI="http://www.w3.org/2000/01/rdf-schema#comment"/>
    <IRI>Agent</IRI>
   <Literal>An agent (eg. person, group, software or physical artifact).</Literal>
 </AnnotationAssertion>
</Ontology>
```

Example 2: The OWL/XML generated from Figure 3

Properties 1.4

The properties of the declared objects can be stated via the \axiom macro. Its first argument is an OWL formula marked up in prefix notation³, and the second one a natural language explanation.

```
\begin{document}
Axiom: agent || document
Agents are not Documents
 <DisjointClasses>
   <Annotation>
     <AnnotationProperty IRI="http://www.w3.org/2000/01/rdf-schema"/>
     <Literal>Agents are not Documents</Literal>
   </Annotation>
   <Class IRI="Agent"/>
   <Class IRI="Document"/>
 </DisjointClasses>
```

Example 3: An Axiom

2 Limitations

In this section we document known limitations. If you want to help alleviate them, please feel free to contact the package author. Some of them are currently discussed in the STFX GitHub repository [sTeX].

 $^{^3{\}rm EdNote}$: explain this better

1. none reported yet

3 The Implementation

The functionality is spread over the owl2onto class and package. The class provides the document environment and the ontology element corresponds to it, whereas the package provides the concrete functionality.

3.1 The owl2onto Class

We first define the owl2onto class, which on the LaTeX side just calls the article class.

- 1 (*cls)
- 3 \DeclareOption*{\PassOptionsToClass{\CurrentOption}{article}}
- 4 \ProcessOptions
- 5 \LoadClass{article}
- 6 \RequirePackage{modules}
- 7 \RequirePackage{owl2onto}

The owl2onto class also supplies the top-level document environment, which we redefined so that we can provide KeyVal arguments.

EdN:4 document

The document environment is redefined to allow a baseURI⁴

- 8 \srefaddidkey{ontology}
- 9 \addmetakey{ontology}{baseURI}
- 10 \newcommand\ontology[1][]{\document\metasetkeys{ontology}{#1}%}
- 11 \importmodule[owl2]{OWL2}%
- $\label{lem:lemodule} $$12 \ifx\sref@id\emodule}\else\begin{module}[id=\sref@id]\fi]$
- 13 \newcommand\endontology{\end{module}\enddocument}
- 14 (/cls)

3.2 Classes and Properties

Before we provide the core functionality, we need to ensure that the modules and presentation packages are loaded. For LATEXML we also initialize the package inclusions.

- 15 (*package)
- 16 \RequirePackage{amstext}
- 17 \RequirePackage{presentation}

We first ste up a utility macro that allows us to export values

\exportvalue

- 18 \def\exportvalue#1#2{%
- 19 \expandafter\def\csname\declaration@cseq #2\expandafter\endcsname\expandafter{#1}

 $^{^4{\}rm EDNote}.$ @Deyan, need to remember the baseURI in a keyword, so that we can use it in the class and property environments

```
20 \expandafter\g@addto@macro\csname module@defs@\mod@id\expandafter\endcsname\expandafter%
              21 {\expandafter\def\csname\declaration@cseq #2\expandafter\endcsname\expandafter{#1}}}
\declaration
              22 \addmetakey{declaration}{id}
              23 \addmetakey{declaration}{cseq}
              24 \addmetakey{declaration}{type}
              25 \addmetakey{declaration}{name}
              26 \newcommand\declaration[2][]{\metasetkeys{declaration}{#1}%
              27 \ifx\declaration@cseq\@empty\else
              28 \expandafter\exportvalue{\ontology@baseURI\declaration@name}{@URI}
              29 \expandafter\exportvalue{\expandafter\text\declaration@name}{}
              31 \noindent\textbf{\declaration@type: \declaration@name}\par\noindent #2\par\noindent}
      \axiom
              32 \addmetakey{axiom}{id}
              33 \addmetakey{axiom}{cseq}
              34 \addmetakey{axiom}{type}
              35 \addmetakey{axiom}{name}
              36 \newcommand\axiom[3][]{\metasetkeys{axiom}{#1}%
              37 \noindent\textbf{Axiom:} #2\par\noindent #3\par\noindent}
```

3.3 Using Ontologies

useontology

```
38 \def\useontology#1#2{\input} 39 \langle /package \rangle
```
