`smultiling.sty`: Multilinguality Support for SТEX

Michael Kohlhase, Deyan Ginev
Jacobs University, Bremen
http://kwarc.info/kohlhase

October 15, 2017

Abstract

The `smultiling` package is part of the SТEX collection, a version of TEX/LATEX that allows to markup TEX/LATEX documents semantically without leaving the document format, essentially turning TEX/LATEX into a document format for mathematical knowledge management (MKM).

The `smultiling` package adds multilinguality support for SТEX, the idea is that multilingual modules in SТEX consist of a module signature together with multiple language bindings that inherit symbols from it, which also account for cross-language coordination.

Contents

1 Introduction

We have been using STEX as the encoding for the Semantic Multilingual Glossary of Mathematics (SMGloM; see [**IanJucKoh:sps14**]). The SMGloM data model has been taxing the representational capabilities of STEX with respect to multilingual support and verbalization definitions; see [Koh14], which we assume as background reading for this note.

1.1 STEX Module Signatures

(monolingual) STEX had the intuition that the symbol definitions (\symdef and \symvariant) are interspersed with the text and we generate STEX module signatures (SMS *.sms files) from the STEX files. The SMS duplicate "formal" information from the "narrative" STEX files. In the SMGloM, we extend this idea by making the the SMS primary objects that contain the language-independent part of the formal structure conveyed by the STEX documents and there may be multiple narrative "language bindings" that are translations of each other – and as we do not want to duplicate the formal parts, those are inherited from the SMS rather than written down in the language binding itself. So instead of the traditional monolingual markup in Figure 1, we we now advocate the divided style in Figure 2.

```
\begin{module}[id=foo]
\symdef{bar}{BAR}
\begin{definition}[for=bar]
  A \defiii{big}{array}{raster} ($\bar$) is a\ldots, it is much bigger
  than a \defiii[sar]{small}{array}{raster}.
\end{definition}
\end{module}
```
Example 1: A module with definition in monolingual STEX

We retain the old `module` environment as an intermediate stage. It is still useful for monolingual texts. Note that for files with a module, we still have to extract *.sms files. It is not completely clear yet, how to adapt the workflows. We clearly need a lmh or editor command that transfers an old-style module into a new-style signature/binding combo to prepare it for multilingual treatment.

2 The User Interface

langfiles The smultiling package accepts the langfiles option that specifies – for a module ⟨mod⟩ that the module signature file has the name ⟨mod⟩.tex and the language bindings of language with the ISO 639 language specifier ⟨lang⟩ have the
EdN:1 file name ⟨mod⟩.⟨lang⟩.tex.[1]

---

[1]EDNOTE: implement other schemes, e.g. the onefile scheme.

```
\usepackage{multiling}
\begin{modsig}{foo}
  \symdef{bar}{BAR}
  \symi{sar}
\end{modsig}

\begin{modnl}[creators=miko,primary]{foo}{en}
  \begin{definition}
    A \defiii[bar]{big}{array}{raster} ($\bar$) is a\ldots, it is much bigger
    than a \defiii[sar]{small}{array}{raster}.
  \end{definition}
\end{modnl}

\begin{modnl}[creators=miko]{foo}{de}
  \begin{definition}
    Ein \defiii[bar]{gro"ses}{Feld}{Raster} ($\bar$) ist ein\ldots, es
    ist viel gr"o"ser als ein \defiii[sar]{kleines}{Feld}{Raster}.
  \end{definition}
\end{modnl}
```

Example 2: Multilingual SₜEX for Figure 1.

2.1 Multilingual Modules

modsig   There the `modsig` environment works exactly like the old `module` environment, only that the `id` attribute has moved into the required argument – anonymous module signatures do not make sense.

modnl   The `modnl` environment takes two arguments the first is the name of the module signature it provides language bindings for and the second the ISO 639 language specifier of the content language. We add the `primary` key `modnl`, which can specify the primary language binding (the one the others translate from; and which serves as the reference in case of translation conflicts).[2]

\symi   There is another difference in the multilingual encoding: All symbols are introduced in the module signature, either by a `\symdef` or the new `\symi` macro. `\symi[⟨keys⟩]{⟨name⟩}` takes a symbol name ⟨name⟩ as an argument and re-

\symi*
\symii
\symiii
\symiv
gfc

serves that name. The variant `\symi*[⟨keys⟩]{⟨name⟩}` declares ⟨name⟩ to be a primary symbol; see [Koh14] for a discussion. SₜEX provides variants `\symii`, `\symiii`, and `\symiv` – and their starred versions – for multi-part names. The key-value interface ⟨keys⟩ does not have any effect on the LATEX rendering, it can be used to embed metadata. For instance, the gfc key allows to specify the grammatical category in terms of the Resource Grammar of the Grammatical Framework [**GFResourceGrammar:on**].

2.2 Multilingual Definitions and Crossreferencing Terms

We do not need a new infrastructure for defining mathematical concepts, only the realization that symbols are language-independent. So we can use symbols for the

---

[2]EDNOTE: @Hang: This needs to be implemented in LaTeXML

coordination of corresponding verbalizations. As the example in Figure 2 already shows, we can just specify the symbol name in the optional argument of the `\defi` macro to establish that the language bindings provide different verbalizations of the same symbol.

For multilingual term references the situation is more complex: For single-word verbalizations we could use `\atrefi` for language bindigns. Say we have introduced a symbol `foo` in English by `\defi{foo}` and in German by `\defi[foo]{Foo}`. Then we can indeed reference it via `\trefi{foo}` and `\atrefi{Foo}{foo}`. But one the one hand this blurs the distinction between translation and "linguistic variants" and on the other hand does not scale to multi-word compounds as `bar` in Figure 2, which we would have to reference as `\atrefiii{gro"ses Feld Raster}{bar}`. To avoid this, \mtref the `smultiling` package provides the new macros `\mtrefi`, `\mtrefii`, and `\mtrefiii` for multilingual references. Using this, we can reference `bar` as `\mtrefiii[?bar]{gro"ses}{Feld}{Raster}`, where we use the (up to three) mandatory arguments to segment the lexical constituents.

The first argument it syntactially optional to keep the parallelity to `\*def*` `\*tref*` it specifies the symbol via its name ⟨*name*⟩ and module name ⟨*mod*⟩ in a MMT URI ⟨*mod*⟩?⟨*name*⟩. Note that MMT URIs can be relative:

1. `foo?bar` denotes the symbol `bar` from module `foo`

2. `foo` the module `foo` (the symbol name is induced from the remaining arguments of `\mtref*`)

3. `?bar` specifies symbol `bar` from the current module

Note that the number suffix `i`/`ii`/`iii` indicates the number of words in the actual language binding, not in the symbol name as in `\atref*`.

2.3 Multilingual Views

Views receive a similar treatment as modules in the `smultiling` package. A multilingual view consists of

viewsig 1. a **view signature** marked up with the `viewsig` environment. This takes three required arguments: a view name, the source module, and the target module. The optional first argument is for metadata (`display`, `title`, `creators`, and `contributors`) and load information (`loadfrom` and `loadto`) and

viewnl 2. multiple **language bindings** marked up by the `viewnl` environment, which takes two required arguments: the view name and the language specifier. The optional first key/value argument takes the same keys as `viewsig` except the last two.

```
\begin{viewsig}[creators=miko]{norm-metric}{metric-space}{norm}
  \vassign{base-set}{base-set}
```

```
    \fassign{x,y}{\metric{x,y}}{\norm{x-y}}
 \end{viewsig}
```

Views have language bindings just as modules do, in our case, we have

```
 \begin{viewnl}[creators=miko]{norm-metric}{en}
   \obligation{metric-space}{obl.norm-metric.en}
   \begin{assertion}[type=obligation,id=obl.norm-metric.en]
     $\defeq{d(x,y)}{\norm{x-y}}$ is a \trefii[metric-space]{distance}{function}
   \end{assertion}
   \begin{sproof}[for=obl.norm-metric.en]
     {we prove the three conditions for a distance function:}
     ...
   \end{sproof}
 \end{viewnl}
```

2.4 Mathematical Keywords

For translations of the mathemtical keywords, the `statements` and `sproofs` packages in STEX define special language definition files, e.g. `statements-ngerman.ldf`.[3][4] There is currently only very limited support for this.

3 Limitations

We list the limitations of the `smultiling` package.

3.1 General `babel` Integration

There is currently no integration with the `babel` package that handles language-specific aspects in LaTeX. In particular, selecting the right language must be done manually. In particular, the example from Figure **??** would really have the form given in Figure 3 – see the `\usepackage[usenglish,ngerman]{babel}` in line 2, and the `\selectlanguage` statements in lines 6 and 13.

For the `langfiles` setup, which assumes that module signatures and langauge bindings are in separate files, `babel` integration can be simplified by providing a language-specific preamble file with `\usepackage{`⟨*language*⟩`}{babel}` which is pre-pended to all language binding files when formatted. This preamble can also contain the other langauge-specific packages (e.g. for font encodings, etc.).

3.2 Language-Specific Limitations

Some languages have more problems than others

EdN:3
EdN:4

```
\usepackage{multiling}
\usepackage[usenglish,ngerman]{babel}% babel support
\begin{modsig}{foo}
  \symdef{bar}{BAR}
  \symi{sar}
\end{modsig}
\selectlanguage{english}% english version follows
\begin{modnl}[creators=miko,primary]{foo}{en}
  \begin{definition}
    A \defiii[bar]{big}{array}{raster} ($\bar$) is a\ldots, it is much bigger
    than a \defiii[sar]{small}{array}{raster}.
  \end{definition}
\end{modnl}
\selectlanguage{german}% german umlauts please
\begin{modnl}[creators=miko]{foo}{de}
  \begin{definition}
    Ein \defiii[bar]{gro"ses}{Feld}{Raster} ($\bar$) ist ein\ldots, es
    ist viel gr"o"ser als ein \defiii[sar]{kleines}{Feld}{Raster}.
  \end{definition}
\end{modnl}
```

Example 3: Multilingual SₜₑX with `babel`

Turkish makes = an active character (to give better spacing); this interacts unfa-vorably with the `keyval` package which needs = as key/value separator (and gives it a different catcode). Therefore we need to prohibit this by restricting the `shorthands` option: use `\usepackage[turkish,shorthands=:!]{babel}`.

EdN:5

Chinese needs special fonts and `xelatex`[5].

---

[5]EDNOTE: get Jinbo to document this

4 Implementation

4.1 Class Options

```
1 ⟨∗sty⟩
2 \newif\if@smultiling@mh@\@smultiling@mh@false
3 \DeclareOption{mh}{\@smultiling@mh@true}
4 \newif\if@langfiles\@langfilesfalse
5 \DeclareOption{langfiles}{\@langfilestrue}
6 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{modules}}
7 \ProcessOptions
```

We load the packages referenced here.
```
8 \if@smultiling@mh@\RequirePackage{smultiling-mh}\fi
9 \RequirePackage{etoolbox}
10 \RequirePackage{structview}
```

4.2 Signatures

modsig The `modsig` environment is just a layer over the `module` environment. We also redefine macros that may occur in module signatures so that they do not create markup.
```
11 \newenvironment{modsig}[2][]{%
12 \def\@test{#1}\ifx\@test\@empty\begin{module}[id=#2]\else\begin{module}[id=#2,#1]\fi\ignorespac
13 {\end{module}\ignorespacesandparsafterend}
```

viewsig The `viewsig` environment is just a layer over the `view` environment with the keys suitably adapted.
```
14 \newenvironment{viewsig}[4][]{\def\@test{#1}\ifx\@test\@empty%
15   \begin{view}[id=#2,ext=tex]{#3}{#4}\else\begin{view}[id=#2,#1,ext=tex]{#3}{#4}\fi%
16   \ignorespacesandpars}
17   {\end{view}\ignorespacesandparsafterend}
```

\@sym* has a starred form for primary symbols.
```
18 \addmetakey{symi}{gfc}
19 \newcommand\symi{\@ifstar\@symi@star\@symi}
20 \newcommand\@symi[2][]{\metasetkeys{symi}{#1}%
21   \if@importing\else Symbol: \textsf{#1}\fi\ignorespacesandpars}
22 \newcommand\@symi@star[2][]{\metasetkeys{symi}{#1}%
23   \if@importing\else Primary Symbol: \textsf{#1}\fi\ignorespacesandpars}
24 \newcommand\symii{\@ifstar\@symii@star\@symii}
25 \newcommand\@symii[3][]{\metasetkeys{symi}{#1}%
26   \if@importing\else Symbol: \textsf{#1-#2}\fi\ignorespacesandpars}
27 \newcommand\@symii@star[3][]{\metasetkeys{symi}{#1}%
28   \if@importing\else Primary Symbol: \textsf{#1-#2}\fi\ignorespacesandpars}
29 \newcommand\symiii{\@ifstar\@symiii@star\@symiii}
30 \newcommand\@symiii[4][]{\metasetkeys{symi}{#1}%
31   \if@importing\else Symbol: \textsf{#1-#2-#3}\fi\ignorespacesandpars}
32 \newcommand\@symiii@star[4][]{\metasetkeys{symi}{#1}%
33   \if@importing\else Primary Symbol: \textsf{#1-#2-#3}\fi\ignorespacesandpars}
```

```
34 \newcommand\symiv{\@ifstar\@symiv@star\@symiv}
35 \newcommand\@symiv[5][]{\metasetkeys{symi}{#1}%
36   \if@importing\else Symbol: \textsf{#1-#2-#3-#4}\fi\ignorespacesandpars}
37 \newcommand\@symiv@star[5][]{\metasetkeys{symi}{#1}%
38   \if@importing\else Primary Symbol: \textsf{#1-#2-#3-#4}\fi\ignorespacesandpars}
```

4.3 Language Bindings

```
39 \addmetakey{modnl}{load}
40 \addmetakey*{modnl}{title}
41 \addmetakey*{modnl}{creators}
42 \addmetakey*{modnl}{contributors}
43 \addmetakey{modnl}{srccite}
44 \addmetakey{modnl}{primary}[yes]
```

modnl   The modnl environment is just a layer over the module environment and the
\importmodule macro with the keys and language suitably adapted.

```
45 \newenvironment{modnl}[3][]{\metasetkeys{modnl}{#1}%
46   \def\@test{#1}\ifx\@test\@empty\begin{module}[id=#2.#3]\else\begin{module}[id=#2.#3,#1]\fi%
47   \if@langfiles\importmodule[load=#2,ext=tex]{#2}\else
48   \ifx\modnl@load\@empty\importmodule{#2}\else\importmodule[ext=tex,load=\modnl@load]{#2}\fi%
49   \fi%
50   \ignorespacesandpars}
51 {\end{module}\ignorespacesandparsafterend}
```

viewnl   The viewnl environment is just a layer over the view environment with the keys
EdN:6   and langauge suitably adapted.[6]

```
52 \newenvironment{viewnl}[5][]{\def\@test{#1}\ifx\@test\@empty%
53   \begin{view}[id=#2.#3,ext=tex]{#4}{#5}\else%
54   \begin{view}[id=#2.#3,#1,ext=tex]{#4}{#5}\fi%
55   \ignorespacesandpars}
56   {\end{view}\ignorespacesandparsafterend}
```

4.4 Multilingual Statements and Terms

\mtref   we first first define an auxiliary conditional \@instring that checks of ? is in the
first argument. \mtrefi uses it, if there is one, it just calls \termref, otherwise
it calls \@mtrefi, which assembles the \termref after splitting at the ?.

```
57 \def\@instring#1#2{TT\fi\begingroup\edef\x{\endgroup\noexpand\in@{#1}{#2}}\x\ifin@}
58 \def\@mtref#1?#2\relax{\@@mtref{#1}{#2}}
59 \newcommand\@@mtref[3]{\def\@@cd{#1}\def\@@name{#2}%
60 \ifx\@@cd\@empty%
61 \ifx\@@name\@empty\termref[]{#3}\else\termref[name=\@@name]{#3}\fi%
62 \else%
63 \ifx\@@name\@empty\termref[cd=\@@cd]{#3}\else\termref[cd=\@@cd,name=\@@name]{#3}\fi%
```

---

[6]EDNOTE: MK: we have to do something about the if@langfiles situation here. But this is
non-trivial, since we do not know the current path, to which we could append .⟨lang⟩!

```
64 \fi}
65 \newcommand\mtref[2][]{\if\@instring{?}{#1}\@mtref #1\relax{#2}\else\termref[cd=#1]{#2}\fi}
```

\mtrefi*

```
66 \newcommand\mtrefi[2][]{\if\@instring{?}{#1}\@mtref #1\relax{#2}%
67 \else\termref[cd=#1]{#2}\fi}
68 \newcommand\mtrefis[2][]{\mtrefi[#1]{#2s}}
69 \newcommand\Mtrefi[2][]{\if\@instring{?}{#1}\@mtref #1\relax{\capitalize{#2}}%
70 \else\termref[cd=#1]{\capitalize{#2}}\fi}
71 \newcommand\Mtrefis[2][]{\Mtrefi[#1]{#2s}}
72 \newcommand\mtrefii[3][]{\mtrefi[#1]{#2 #3}}
73 \newcommand\mtrefiis[3][]{\mtrefi[#1]{#2 #3s}}
74 \newcommand\Mtrefii[3][]{\Mtrefi[#1]{#2 #3a}}
75 \newcommand\Mtrefiis[3][]{\Mtrefi[#1]{#2 #3s}}
76 \newcommand\mtrefiii[4][]{\mtrefi[#1]{#2 #3 #4}}
77 \newcommand\Mtrefiiis[4][]{\Mtrefi[#1]{#2 #3 #4s}}
78 \newcommand\Mtrefiii[4][]{\Mtrefi[#1]{#2 #3 #4}}
79 \newcommand\mtrefiiis[4][]{\mtrefi[#1]{#2 #3 #4s}}
80 \newcommand\mtrefiv[5][]{\mtrefi[#1]{#2 #3 #4 #5}}
81 \newcommand\mtrefivs[5][]{\mtrefi[#1]{#2 #3 #4 #5s}}
82 \newcommand\Mtrefiv[5][]{\Mtrefi[#1]{#2 #3 #4 #5}}
83 \newcommand\Mtrefivs[5][]{\Mtrefi[#1]{#2 #3 #4 #5s}}
```

4.5 Miscellaneneous

the \ttl macro (to-translate) is used to mark untranslated stuff. We need a better LaTeXMLtreatment of this eventually that is integrated with MathHub.info.

\ttl

```
84 \newcommand\ttl[1]{\red{TTL: #1}}
85 ⟨/sty⟩
```
